Annex-14

Ambiguity about Test Cycle and its duration: Cl. 18 of Endurance test: Domestic Washing Machines

Please refer to the Clause no. 18 (18.101) of IS 302-2-7 on Endurance test where it states that:

“Lids are opened each time by approximately 45° and doors by 90°, the speed of opening being approximately 1.5 m/s. The force applied to open the lid or door is twice the measured opening force, with a minimum of 50 N and a maximum of 200 N.

Doors are closed at a speed of approximately 1.5 m/s, the force applied being five times the measured closing force, with a minimum of 50 N and a maximum of 200 N. Lids are allowed to close under their own weight but if they fail to latch, a force of five times the measured closing force is applied, with a minimum of 50 N and a maximum of 200 N”.

1. However when a user of washing machine practically operates, it normally takes much more time (thrice of specified time) to cover 1.50 meters in One second. The speed of opening & closing would become so fast, jerky & abrupt that it might break the machine’s door/lid frequently, thus may not be possible to complete the test. Now a days, most of the top loaders auto machines are fitted with soft/slow opening/closing mechanisms (dampers/shockers) for very smooth opening & closing of doors thus may not be possible to match the specified time.

Suggestion: Like in the Refrigerators (*IS 17550-2 Cl. No. 11.1.1.2 Closing sequence*), only certain/ practical number of Opening/closing cycles per minute (12 to 20 per minutes) to be specified.

2. Similarly for the opening and closing force of 50 to 200 Newton is too high as the weight of the door lid is not more that 1.0 to 2.0 Kg thus may not be possible to exert that much force as specified, therefore may not be admissible.

Suggestion: Instead of specified force to operate the opening & closing the doors/lids, whatever actual force as measured, to be reported.
