FOREWORD

This Indian Standard (Third Revision) was adopted by the Bureau of Indian Standards, after the draft finalized by the Petroleum and their Related Products of Synthetic or Biological or Natural Origin Sectional Committee had been approved by the Petroleum, Coal and Related Products Division Council.

Toluene is used as a raw material in manufacture of alkylated, nitrated and halogenated organic intermediates for petrochemical dyestuffs and fine chemical industries. It is also used as a solvent in paint, coating, adhesive and ink formulations.

Toluene is derived by suitable fractionation of crude oil and refining by washing with acid or by hydro-refining of crude benzoyl recovered from the gas produced during carbonization of coal in coke ovens and retorts or recovered as by-products in petroleum refining or petrochemical operations.

This standard was first published in 1955 and was based on overseas national standards including the work accomplished till then by the Committee, ISO/TC 78 'Aromatic hydrocarbons' of the International Organization for Standardization (ISO).

First revision of the standard was published in 1967. In the first revision, toluene with especially low content of non-sulphonable hydrocarbons was covered. Besides, the requirement of distillation range was tightened in order to take care of the possibility of admixture with benzene. Colorimetric tests were also prescribed for acid wash test and colour.

Second revision of the standard was published in 2011. In the second revision, the requirements of residue on evaporation and corrosive sulphur were deleted, and gas chromatographic (GC) method was incorporated for determination of purity. Methods of test for distillation range and relative density were modified.

Earlier, toluene was essentially a coal base product which was being made available as by-product from coke ovens of steel plants. The requirements and methods of test were also stipulated on the basis of the publication by national benzoyl and allied products association (NBA) and the standardization of Tar Products Tests Committee (STPC), U.K., in order to suit the prevailing quality of the product. However, during second revision, the Committee took cognizance of the fact that consequent upon exploration of oil fields, especially the Bombay High, substantial quantities of crude was available in the country which completely changed the scenario.

There was a distinct shift in the production of various aromatic hydrocarbons from coal base to petroleum base, as a result of which toluene was available in abundance. The toluene derived from petroleum was more suitable for various purposes as compared to that which was derived from coal.

The Committee also observed that this standard covers the requirements of reagent grade toluene, hence IS 1839 : 1961 "Toluene, reagent grade" was withdrawn.

In this revision, following major changes have been made:

- a) New instrumental test methods have been added as the refining industry in India have upgraded their testing methods in conformance to International Standards;
- b) Significance of tests has been added;
- c) Requirement of thiophene and H₂S/SO₂ has been removed as this requirement is deleted from international specification of toluene;
- d) The purity, Pt-Co colour, and non-aromatics specifications have been modified in line with international specifications with addition of acid wash colour; and
- e) Distillation test has been made optional as vapor generation is maximum during distillation test and inhalation of benzene/toluene vapors may be detrimental to health of testing personnel. Toluene purity is an essential requirement of the standard; hence distillation test may be kept optional.

(Continued on third cover)

Indian Standard
TOLUENE — SPECIFICATION
(Third Revision)

1 SCOPE

This standard prescribes the requirements and the methods of sampling and test for toluene.

2 REFERENCES

The standards given in [Annex A](#) contain provisions which, through reference in the text, constitute provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent edition of these standards.

3 REQUIREMENTS

The material shall comply with the requirements given in [Table 1](#).

4 PACKING AND MARKING**4.1 Packing**

4.1.1 The material shall be packed as agreed to between the purchaser and the supplier.

4.1.2 All the containers in which the material is packed shall be dry, clean, leak proof, and free from substances soluble in toluene.

4.1.3 The containers shall be securely closed, protected from light, and shall be stored in a cool place.

4.1.4 As the material is classified as flammable and dangerous goods, the containers for storage and transport of the material, shall, in addition, comply with the requirements of the latest issue of red tariff and the requirements as laid down from time to time by the chief controller of explosives, government of India, for packing, storage, and transit of flammable liquids and the board of trade regulations as applicable therein for transport by steamers.

4.1.5 Necessary safeguards against the risk arising from the storage and handling of large volumes of flammable liquids (*see* IS 1446) shall be provided and all due precautions shall be taken [*see* IS 1260 (Part 1)] at all times to prevent accidents by fire or explosion.

4.1.6 Except when they are opened for the purpose of cleaning and rendering them free from toluene vapour, all empty tanks or other containers shall be kept securely closed unless they have been cleaned and freed from toluene vapour.

4.2 Marking

4.2.1 Each container shall be marked with the following information:

- a) Name of the material;
- b) Name of the manufacturer and recognized trademark, if any;
- c) Net mass of the material in the container;
- d) Identification in code or otherwise to enable the lot to be traced back from records;
- e) Date or year of manufacture/packing; and
- f) Any other statutory requirements.

4.2.2 Each container shall have the caution label 'FLAMMABLE' together with the corresponding symbol for labelling of dangerous goods as given in IS 1260 (Part1).

4.2.3 BIS Certification Marking

The product(s) conforming to the requirements of this standard may be certified as per the conformity assessment schemes under the provisions of the *Bureau of Indian Standards Act, 2016* and the Rules and Regulations framed thereunder, and the products may be marked with the Standard Mark.

5 HANDLING

Toluene is toxic and therefore it shall be handled carefully. Exposure of toluene in atmosphere should be monitored regularly. Persons exposed to toluene shall be periodically checked according to factory rules and local state regulations (*see* IS 4644).

6 SAMPLING

Representative samples of the material shall be prepared as prescribed in [Annex E](#).

7 TEST METHODS

Tests shall be conducted according to the methods prescribed in col (4) of [Table 1](#).

7.1 Quality of Reagents

Unless otherwise specified, pure chemicals and distilled water (*see* IS 1070) shall be employed in tests.

NOTE — 'Pure chemicals' shall mean chemicals that do not contain impurities, which affect the results of analysis.

ANNEX B

[Table 1, Sl No (iv)]

DETERMINATION OF DENSITY OR RELATIVE DENSITY

B-1 GENERAL

Pyknometer method for determination of density or relative density is specified.

B-2 SIGNIFICANCE

Density is a fundamental physical property that can be used in conjunction with other properties to characterize both the light and heavy fractions of petroleum and petroleum products. It is used for calculating the mass when volume is known and for the conversion of measured volumes to volumes at the standard temperature of 15 °C. It is also used to identify the stream/product to some extent. Though it gives a very uncertain indication of the fuel quality, density can indicate gross contamination increase, if any. This property can also be used as an indication whether the product has been contaminated during the movement.

B-3 PYKNOMETER METHOD**B-3.1 Outline of the Pyknometer Method**

For materials given in [Table 2](#), the sample is drawn into a weighed and calibrated bicapillary pyknometer. The filled pyknometer is allowed to come to equilibrium at any convenient temperature between 10 °C and 30 °C. The equilibrium temperature is measured to the nearest 0.02 °C. The weight is determined by using a beam balance. The density, relative density, or commercial density at the desired reference temperature is then calculated from the sample weight, a calibration factor proportional to an equal volume of water, and a multiplier which corrects for the buoyancy of air and the change in volume of the pyknometer and the sample due to deviation from the chosen reference temperature.

B-3.2 Apparatus**B-3.2.1 Pyknometer**

9 ml to 10 ml capacity, conforming to the dimensions given in [Fig. 1](#), constructed of borosilicate glass, and having a total weight not exceeding 30 g.

B-3.2.3 Bath Thermometer — Capable of measuring temperature in the range of – 8 °C to + 32 °C.

B-3.3 Preparation of Apparatus**B-3.3.1 Acid Cleaning**

When liquid fails to drain cleanly from the walls of the pyknometer or its capillary, clean with hot chromic acid solution thoroughly and rinse well with water. Dry at 105 °C to 110 °C for at least 1 h, preferably with a slow current of filtered air passing through the pyknometer.

B-3.3.2 Solvent Cleaning

For use between determinations, rinse with toluene and then with anhydrous acetone, drying with a filtered stream of dry air.

B-3.4 Calibration of Apparatus

B-3.4.1 Using the procedure described in [B-3.5](#), determine the weight of freshly boiled reagent water held by the pyknometer with the water level at each of three different scale points on the graduated arms. Make all weighings on the same day, using the same balance and weights.

B-3.4.2 Calculate the volume, V_T^P , at each scale point tested by means of the following equation, carry all calculations in 6 non-zero digits and round to 4 decimal places:

$$\text{Pyknometer capacity, } V_T^P, \text{ ml} = A \times \left(\frac{W^W}{d_t^W} \right) + B \times (T - t)$$

where

V_T^P = volume, in ml, of pyknometer at reference temperature, T ;

A = air buoyancy coefficient, in g, a constant for the temperature range involved = 1.001 064; W^W = Weight of water in air, contained in the pyknometer;

d_t^W = density of water at t (see [Table 3](#));

B = volumetric coefficient of expansion of 9.5 ml of a borosilicate glass pycnometer = 9.26276×10^{-5} ml/°C.

T = reference temperature, 20 °C or 15.56 °C; and

B-3.4.3 Prepare a calibration curve by plotting apparent volume, V_A (the sum of the scale readings on the two arms of the pycnometer) against the corresponding calculated volume, V_T^P . If a straight line cannot be drawn through the three points, discard the data and determine three additional points so that a straight calibration line can be drawn, such that no data point lies more than 0.000 2 ml units from the line. If neither set of data meets the condition, the diameters of the graduated capillary arms are not sufficiently uniform, and the pycnometer shall be discarded.

B-3.4.4 From the curve obtained, prepare a table of apparent volume, V_A (sum of scale readings of both arms), as apparent volume against corresponding calculated volumes, V_T^P , in increments of 0.000 1 ml. Label [Table 3](#) with the reference temperature to which it applies.

B-3.5 Procedure

B-3.5.1 Weigh the clean, dry pycnometer to 0.1 mg and record the weight.

B-3.5.2 With the sample at approximately the test temperature, fill the pycnometer by holding it in an upright position and placing the hooked tip in the sample; the liquid will then be drawn over the bend in the capillary by surface tension. Allow the pycnometer to fill by siphoning (about 1 min) and break the siphon when the liquid level in the bulb arm of the pycnometer reaches the lowest graduation mark.

B-3.5.3 Thoroughly dry the wet tip. Wipe the body of the pycnometer with a chemically clean, lint-free cloth slightly damp with water (*see Note*) and weigh the filled pycnometer to the nearest 0.1 mg.

NOTE — In atmospheres below 60 percent relative humidity, drying the pycnometer by rubbing with a dry cotton cloth will induce static charges equivalent to a loss

of about 1 mg or more in the weight of the pycnometer. This charge may not be completely dissipated in less than 30 min, and can be detected by touching the pycnometer to the wire hook in the balance and then drawing it away slowly. If the pycnometer exhibits an attraction for the wire hook, it may be considered to have a static charge.

B-3.5.4 Place the pycnometer in the holder in a constant temperature bath held at any convenient temperature between 10 °C and 30 °C within ± 0.02 °C. When the liquid level has reached temperature equilibrium (usually in about 10 min) and while still in the water bath, read the scale to the nearest 0.2 small divisions at the liquid level in each arm.

B-3.6 Calculation

Compute the density or relative density, or both, by means of the following equations:

$$\text{Density, g/ml at } 20^\circ\text{C} = (W^S/V_{20}^P) \times F_{20} + 0.001\ 21$$

$$\text{Relative density at } 20/20^\circ\text{C} = [(W^S/V_{20}^P) \times F_{20} + 0.001\ 21] \times 1.000\ 96$$

where

W^S = observed weight of sample, in g, corrected for variation of weights;

V_{20}^P = calculated volume, in ml, V_T^P of sample at 20 °C obtained from the pycnometer calibration table; and

F_{20} = constants taken from [Table 2](#), corresponding to the test temperature.

All dimensions in millimeters.

FIG. 1 PYCNOMETER

All dimensions in millimetres.

ANNEX C

[Table 1, Sl No. (v)]

DETERMINATION OF TOTAL SULPHUR CONTENT

C-1 OUTLINE OF THE METHOD

The sample is reacted with Raney nickel. The hydrogen sulphide liberated from the nickel sulphide thus formed is absorbed and titrated with mercuric acetate. Certain oxygenated sulphur compounds are not completely determined and some olefins interfere with the test.

NOTE — Stringent precautions shall be taken to avoid sulphur contamination from atmosphere, apparatus, and reagents or other sources. Care should be taken not to allow sodium hydroxide reagent or apparatus 'wet' with this reagent to be exposed to laboratory atmosphere.

C-2 APPARATUS**C-2.1 Reduction Apparatus**

The reduction apparatus shall be of the shape, dimensions and assembly as shown in [Fig. 3](#). The cone and delivery tube is connected to a supply of nitrogen via a dreschel bottle and the luted venting device. Rubber tubing shall not be used for nitrogen supply connection; PVC or other sulphur-free plastics tubing is suitable. The 100-ml flask is heated electrically by means of a mantle. The apparatus consists of the following:

C-2.1.1 Reduction Flask

100 ml round-bottomed flask with two short upright necks having respectively 10/19 and 14/23 ground-glass sockets (*see* IS 5165). The flask is also fitted with a 10/19 ground-glass socket inclined to centre-bottom.

C-2.1.2 Glass Delivery Tube

A 10/19 (*see* IS 5165) cone and stem with the end drawn out to a 1 mm hole, of such a length that the tip is within 5 mm of the centre of the bottom of the flask when the cone is in position in the inclined socket.

C-2.1.3 Tap Funnel — Capacity 20 ml with 10/19 cone and socket (*see* IS 5165).

C-2.1.4 Adaptor — Right-angle connection with 10/19 cone.

C-2.1.5 Condenser

A Liebig condenser, effective length 150 mm, with a 14/23 cone and socket.

C-2.1.6 Absorber

A delivery tube of (6 mm ± 0.5 mm) outer diameter bent at 110° and containing a small expansion chamber in the upright section. The lower end of the tube has a 1 mm hole, and fits into a covered 200 mm x 32 mm outer diameter boiling tube. The upper end of the delivery tube is bent at an angle of 70° and fitted with a 14/23 cone at a distance of approximately 135 mm from the longer arm.

C-2.1.7 Gas Washing Bottle — Dreschel bottle having a dip-tube of about 6 mm outer diameter.

C-2.1.8 Microburette — Capacity 10 ml arranged so that the liquid in the absorber can be titrated.

C-2.2 Flask

A 500 ml stoppered conical flask, marked at the 400 ml level with the cone and stopper lubricated with silicone grease.

C-2.3 Measuring Cylinder, capacity 10 ml.**C-2.4 Pipette**

C-2.5 Thermometer — Any suitable thermometer including the interval 75 °C to 80 °C.

C-3 REAGENTS**C-3.1 Acetone****C-3.2 Propan-2-ol****C-3.3 Nitrogen**

C-3.4 Raney Nickel — A 1:1 mixture of nickel and aluminium.

C-3.5 Sodium Hydroxide Solutions, 2.5 N and 1 N

Clean the conical flask with nitric acid/potassium dichromate mixture [prepared by dissolving 5 g of potassium dichromate in 5 ml of water and adding 100 ml of concentrated (15 N) nitric acid, stirring continuously] and rinse thoroughly with water. Fill with water to the 400 ml mark and add the mass of sodium hydroxide pellets appropriate for preparation of the 2.5 N or 1 N solution. Swirl gently until dissolution is complete and allow to cool.

C-3.6 Hydrochloric Acid, 5N

C-3.7 Potassium Hydroxide — 40 g/l solution in ethanol.

C-3.8 Mercuric Acetate Solution

Dissolve 0.675 g of mercuric oxide, previously dried at 100 °C, in 50 ml of water containing 2 ml of glacial (17 M) acetic acid. Dilute to 1 000 ml with water and mix well. Dilute 50 ml of the solution thus prepared to 250 ml with water and mix well. One milliliter of the diluted solution is equivalent to 0.02 mg of sulphur.

C-3.9 Dithizone Indicator Solution — 1 g/l in acetone, prepared fresh daily, or every 3 days, if stored in a refrigerator.

NOTE — When experience has been gained with the concentration of indicator required, a few grains of the solid indicator may be added to the absorber. In this way any instability of indicator solution is overcome.

C-4 PROCEDURE

C-4.1 Clean the apparatus thoroughly with a mixture of nitric acid and potassium dichromate. Rinse thoroughly with water and acetone and dry in an oven which has not been contaminated with sulphur or sulphur containing materials in previous use. The apparatus is self-scouring and, when in constant use, shall not be cleaned between determinations, except for rinsing the flask, delivery tube, absorber and thermometer with water. When not in constant use, it shall be cleaned between determinations with water and acetone.

NOTE — For activating nickel perfectly, the weighed raney nickel is kept in caustic solution for at least 4 h.

C-4.2 Weigh accurately about 0.5 g of Raney nickel and put it in the reduction flask using a cone made from glazed paper, and add 10 ml of sodium hydroxide solution (2.5 N) from the measuring cylinder. Care shall be taken at this stage because there is a vigorous reaction.

C-4.3 When the reaction has subsided, swirl the liquid in the flask to bring the nickel adhering to the sides of the flask to the bottom. Set the flask aside for 10 min and then decant the supernatant liquid. Wash down both necks of the flask with 10 ml to 15 ml of water. Swirl the water vigorously to disturb the nickel residue, but avoid entrainment of air and, with minimum delay for settling, decant the water as completely as possible without too much attention to removing the last drop. Repeat the water wash three more times, and follow with a wash with 10 ml of propan-2-ol. Decant most of the propan-2-ol leaving enough to cover the catalyst, and add a further 10 ml of propan-2-ol.

NOTE — Incrustations around the stoppers and necks of sodium hydroxide bottles contain sufficient quantities of sulphur to affect test results. Such incrustations should be removed without allowing material to fall into the bottle. Before using solution from the bottle, pour a little to waste. Replace the stopper promptly.

C-4.4 Assemble the apparatus except for the tap funnel, lightly greasing all the joints with silicone grease. Add 50 ml of a mixture of equal parts of sodium hydroxide solution (1 N) and acetone to the boiling tube and add 5 drops of the dithizone indicator solution.

C-4.4.1 Calculate the appropriate size of sample as follows:

100 ml/specified or expected sulphur content in mg/kg.

Subject to a maximum of 50 ml, pipette the volume calculated above into the flask through the 10/19 socket.

C-4.5 Complete the assembly of the apparatus. Measure 10 ml of the hydrochloric acid solution into the tap funnel. Pass nitrogen at the rate of 2 or 3 bubbles/second as shown in the dreschel bottle containing the ethane-di-ol potassium hydroxide solution. Note the burette reading and titrate the contents of the absorber with the mercuric acetate solution to a pale pink colour.

C-4.5.1 Heat the flask at such a rate that the contents boil gently in about 10 min. Maintain the heating for a further period of 30 min at such a rate that small bubbles rise copiously from the nickel and gentle refluxing occurs.

C-4.5.2 Increase the input to the heating mantle slightly and allow the hydrochloric acid solution to drip slowly (10 ml in 5 min to 10 min) into the flask. Vigorous generation of hydrogen will occur, but little or no hydrogen sulphide will be evolved until about half the hydrochloric acid has entered the flask. Titrate the absorbing solution to a pink colour. As hydrogen sulphide is evolved and absorbed and the colour of the absorbing solution reverts to yellow, titrate in more mercuric acetate solution in order to restore the pink colour. After the addition of the acid, open the tap of the funnel occasionally to sweep forward any hydrogen sulphide that may have collected below it. When the evolution of hydrogen sulphide has almost ceased, increase the nitrogen flow rate to about 5 bubbles/second in the bottle to improve the transfer of hydrogen sulphide to the absorber.

C-4.5.3 When the evolution of hydrogen sulphide has apparently ceased, turn off the nitrogen temporarily and cool the flask by reducing the heat input and by blowing a little air on to it or by applying a damp cloth. The reduction

in pressure will cause the absorbing solution to rise up the delivery tube. Restore the nitrogen flow before the absorbing solution reaches the bend above the cone. Repeat this operation at about 2 min intervals until no more hydrogen sulphide is washed down. If any liquid enters the cone, the test shall be abandoned.

C-4.5.4 Boil the contents of the flask vigorously and continue the titration to the end point.

C-4.5.5 Carry out a blank test on the reagents omitting the sample. Once a day is normally sufficient but the blank shall always be re-determined, if there is any change in the reagents, apparatus, or laboratory atmosphere which could conceivably affect the blank value. This value should not exceed 0.6 ml.

C-5 CALCULATION

$$\text{Total sulphur content, mg/kg} = \frac{20 \times (V_1 - V_2)}{V \times D}$$

where

- V_1 = volume, in ml, of mercuric acetate solution used for the sample titration;
- V_2 = volume, in ml, of mercuric acetate solution used for the blank test;
- V = volume, in ml, of sample taken for the test; and
- D = density, in g/ml, of the sample at the temperature at which it was measured.

FIG. 3 REDUCTION APPARATUS

ANNEX D

[Table 1, Sl No. (vi)]

DETERMINATION OF DISTILLATION RANGE

D-1 OUTLINE OF THE METHOD

The method includes distillation of 100 ml test portion under prescribed conditions, which are equivalent to simple batch distillation, systematic observation of thermometer readings and volumes of condensate and calculation of the results from these data with correction to standard atmospheric pressure.

D-1.1 SIGNIFICANCE

Distillation indicates volatility of the product. This is an important characteristic not only for the identification of product, but also for its application. It is also used as an internal quality control tool, and in R & D work on hydrocarbons and related materials. It gives a broad indication of general purity of the product.

D-2 DEFINITIONS

For the purpose of this annex, the following definitions shall apply:

D-2.1 Initial Boiling Point

The temperature noted (corrected, if required) at the moment when the first drop of condensate falls from the tip of the condenser during a distillation carried out under standardized conditions.

D-2.2 Dry Point

The temperature noted (corrected, if required) at the moment of vaporization of the last drop of liquid from the bottom of the flask during a distillation carried out under standardized conditions, discarding any liquid on the side of the flask and on the thermometer.

D-2.3 Boiling Range

The temperature interval between the initial boiling point and dry point.

D-3 APPARATUS

The apparatus, a suitable form of which is shown in [Fig. 4](#) to [Fig. 7](#), shall comprise the following items:

D-3.1 Distillation Flask — Made of heat resistant glass, of capacity 200 ml, conforming to the dimensions shown in [Fig. 4](#).

D-3.2 Thermometer

Analog temperature measurement device ([D-3.2.1](#)) or digital temperature measurement device ([D-3.2.2](#)).

D-3.2.1 Analog Temperature Measurement Device

Mercury-in-glass type, nitrogen-filled, graduated on the stem, enamel-backed, and conforming to [Table 4](#).

D-3.2.2 Digital Temperature Measurement Device

Temperature measurement systems using thermocouples or resistance thermometers shall exhibit the same temperature lag, emergent stem effect and accuracy as the equivalent mercury-in glass thermometer. This shall be confirmed at regular intervals potentiometrically by the use of standard precision resistance, depending on the type of probe.

Another technique is to distill pure toluene (99.9 + percent purity) and compare the temperature indicated by the thermocouple or resistance thermometer with that shown by the mercury-in glass thermometer.

D-3.3 Draught Screen**D-3.3.1 For Use with a Gas Burner**

D-3.3.1.1 The draught screen shall be rectangular in cross-section and open at the top and bottom. It shall have the dimensions shown in [Fig. 5](#) and be made of sheet of metal of thickness approximately 1.8 mm.

D-3.3.1.2 In each of the two narrower sides of the draught screen, there shall be two circular holes of diameter 12.5 mm, the centers of which are situated 25 mm above the base of the draught screen. These holes shall occupy the positions shown in [Fig. 5](#).

D-3.3.1.3 At the middle of each of the wider sides, a vertical slot for the condenser tube, dimensioned approximately as shown in [Fig. 5](#), shall be cut downwards from the top of the screen. A removable shutter of suitable dimensions shall be provided for closing whichever vertical slot is not in use. This arrangement enables the condenser (*see* [D-3.6](#)) to be placed on either side of the draught screen.

D-3.3.1.4 A shelf of ceramic material, of thickness 3 mm to 6 mm and possessing a centrally cut circular hole of diameter 75 mm to 100 mm, shall be supported horizontally in the screen and shall fit closely to the sides of the screen, to ensure that hot gases from the source of heat (see [D-3.5](#)) do not come in contact with the sides or neck of the flask (see [D-3.1](#)). The supports for this shelf may conveniently consist of triangular pieces of metal sheet firmly fixed to the screen at its four corners.

D-3.3.1.5 A board as described in [D-3.4](#) shall rest on this shelf.

D-3.3.1.6 In one of the narrower sides of the screen, a door shall be provided having the approximate dimensions shown in [Fig. 5](#) and overlapping the opening in the screen by approximately 5 mm all round.

D-3.3.2 *For Use with an Electric Heater*

When an electric heater is employed, the portion of the draught screen above the shelf shall be as described in [D-3.3.1](#), but the lower portion (including the shelf) may be modified or omitted, provided that the changes does not expose the distillation flask to draughts (see [Fig. 6](#)). Provision shall be made for adjustment of the shelf to facilitate fitting of the flask.

D-3.4 Ceramic Boards

D-3.4.1 It shall be of thickness 3 mm to 6 mm, with central holes of diameter 32 mm or 38 mm respectively and overall dimensions not less than 150 mm². When a gas heater is employed, this board shall rest on the shelf described in [D-3.3.1](#) when an electric heater is employed, the same arrangement shall be adopted, if the shelf is present; alternatively, the board may be placed directly on the heater or it may form the top of the heater. Provision shall be made for adjusting the height of the heater.

D-3.4.2 Whichever type of heater is employed; direct heat shall only be applied to the flask through the central hole in the ceramic board.

D-3.5 Source of Heat

Comprising either a gas burner so constructed that sufficient heat can be obtained to distill the product at the uniform rate specified [D-5.3](#). A sensitive regulating valve or governor is desirable or an electric heater capable of complying with the same requirements (A heater of low heat retention, adjustable from 0 kW to 1 kW, has been found satisfactory).

D-3.6 Condenser

D-3.6.1 A seamless brass tubing, of length 560 mm, outside diameter 14 mm and wall thickness 0.8 mm to 0.9 mm, surrounded by a metal cooling bath, preferably of copper or brass. The tube shall be set so that a length of approximately 390 mm is in contact with the cooling medium in the cooling bath, with about 50 mm outside the cooling bath at the upper end, and about 110 mm outside at the lower end. The length of the tube projecting at the upper end shall be straight and set at an angle of 75 degrees to the vertical. The section of the tube inside the cooling bath may be either straight or bent in any suitable continuous smooth curve. The average gradient shall be 0.26 mm per linear millimetre of the condenser tube ($\sin 15^\circ$), and no part of the immersed portion of the condenser tube shall have a gradient less than 0.24 mm nor more than 0.28 mm per linear millimeter of the tube. The projecting lower portion of the condenser tube shall be curved downward for a length of 76 mm and slightly backward so as to ensure contact with the wall of the receiver (see [D-3.7](#)) at a point 25 mm to 32 mm below the top of the receiver when it is in a position to receive the distillate. The lower end of the condenser tube shall be cut off at an acute angle so that the tip may be brought into contact with the wall of the receiver.

D-3.6.2 The capacity of the cooling bath shall be not less than 5.5 litre of cooling medium. The arrangement of the tube in the cooling bath shall be such that its center line is not less than 32 mm below the plane of the top of the bath at its point of entrance, and not less than 19 mm above the floor of the bath at its exit. Clearances between the condenser tube and the walls of the bath shall be at least 13 mm, except for the section adjacent to the points of entrance and exit.

D-3.6.3 The cooling bath may be provided with a tap at the bottom for drainage or inlet, and with an overflow tube near the top.

D-3.6.4 The main dimensions of the tube and cooling bath are shown in [Fig. 5](#).

D-3.7 Receiver

It shall be of capacity 100 ml, complying with the details shown in [Fig. 7](#). None of the graduation lines shall be in error by more than 1 ml. The shape of the base is optional but it shall be such that the receiver does not topple when placed empty on a surface inclined at an angle of 15 to the horizontal.

D-3.8 **Barometer** — Capable of measuring to the nearest 1 mbar, 0.1 kPa or 1 mm Hg.

D-4 ASSEMBLY AND PREPARATION OF APPARATUS

D-4.1 Assembly

Assemble the apparatus, swabbing out the condenser with a piece of lint-free cloth attached to a wire cord or by any other suitable means, and paying attention to the following details:

D-4.1.1 Position and Choice of Thermometer

Use any thermometer as indicated at [D-3.2](#). Centre the thermometer/probe into the neck of the flask through a tight-fitting silicone-rubber or cork stopper so that the upper end of the contraction chamber is level with the lower wide of the vapour tube at its junction with the neck of the flask.

D-4.1.2 Support for Flask

If a draught screen with ceramic shelf is used, place the appropriate ceramic board (see [D-3.4](#) and [D-5.3](#)) on top of the shelf so that the two holes are concentric.

D-4.1.3 Connection of Flask to Condenser

D-4.1.3.1 Make a leak-proof connection of the flask (see [D-3.1](#)) to the tube of the condenser (see [D-3.6](#)) by means of a tight-fitting silicone-rubber or cork stopper through which the vapour tube of the flask passes. Connect the flask to the condenser so that the flask is in a vertical position; the end of the vapour tube shall extend at least 25 mm and not more than 50 mm beyond the cork into the condenser tube and shall be co-axial with it.

D-4.1.3.2 Place the flask in such a position on the board that the base completely closes the hole in the board.

D-4.2 Filling of Cooling Bath

Fill the bath with water or with water and crack ice in sufficient quantity to cover the condenser tube, so as to ensure that the temperature of the bath at the start of and during distillation remains between 25 °C to 30 °C.

D-4.3 Adjustment of Temperature of Sample

Adjust the temperature of the sample to between 20 °C to 30 °C, to prevent excessive evaporation of the product.

D-5 PROCEDURE

D-5.1 Test Portion

Using the graduated receiver (see [D-3.7](#)), measure

(100 ± 0.5) ml of the sample at the temperature to which it has been adjusted as specified in [D-4.3](#). Remove the flask (see [D-3.1](#)) from the apparatus and transfer the test portion directly to the flask, allowing the receiver to drain for 15s to 20s. Do not allow any of the test portion to enter the vapour tube.

D-5.2 Apparatus Assembly

D-5.2.1 Connect the flask to the condenser (see [D-3.6](#)) and insert the thermometer/probe (see [D-3.2](#)) as described in [D-4.1.1](#) and position the flask as described in [D-4.1.3](#). Place the receiver (see [D-3.7](#)), without drying, at the outlet of the condenser tube in such a position that the condenser tube extends into the receiver at least 25 mm but does not extend below the 100 ml mark.

D-5.2.2 Place a flat cover on the top of the receiver to prevent entry of condensed moisture.

D-5.3 Operating Conditions

A certain amount of judgement is necessary in choosing the best operating conditions to obtain acceptable accuracy and reproducibility. As a general guide it is recommended that the following conditions shall be established:

- (a) Flask support — Hole diameter, 32 mm; and
- (b) Heating rate — Time from application of heat to collection of first drop of distillate 5 min to 10 min, and time for rise of vapour column in neck to flask to side arm, 2.5 min to 3.5 min.

D-5.4 Initial Boiling Point

Record the temperature at the instant the first drop of distillate falls from the tip of the condenser as the initial boiling point (see [D-2.1](#)).

D-5.5 Distillation

Adjust the heat input so that the distillation proceeds at a rate of 4 ml/min to 5 ml/min (approximately 2 drops per second), and move the receiver so that the tip of the condenser tube touches one side of the cylinder after the first drop falls.

D-5.6 Dry Point

Without changing the heater setting, continue distillation beyond the 95 percent point until the dry point (see [D-2.2](#)) is observed. Record the temperature at this moment as the dry point. If a dry point is not obtained (that is, if active decomposition occurs before the dry point is reached, as shown by a rapid evolution of vapour

or heavy fumes, or if there is liquid remaining on the bottom of the flask when the maximum temperature is observed in the distillation thermometer), record this fact.

D-5.7 Atmospheric Pressure

Read and record the barometric pressure to the nearest 1 mbar, 0.1 kPa or 1 mm Hg.

D-6 CALCULATIONS

D-6.1 Thermometer Bore Correction

Apply the correction for any variation in the bore of the thermometer as given by the calibration certificate.

D-6.2 Thermometer Bulb Shrinkage Correction

Apply the correction for shrinkage of the mercury bulb of the thermometer as determined by any change in its ice or steam point, where applicable. Other means can be employed, such as the use of a platinum-resistance thermometer or a recognized standard thermometer.

D-6.3 Barometer Correction

After applying the corrections for thermometer error, correct each reading for deviation of the barometric pressure from normal by adding algebraically the correction, calculated as follows:

$$K \times (760 - p_0) \text{ or} \\ K' \times (1013 - p_1) \text{ or} \\ K' \times (1013 - p_2)$$

where

- K = rate of change of boiling point, in °C/mm Hg with pressure (see [Table 5](#));
- K' = rate of change of boiling point, in °C/mbar or °C/0.1 kPa with pressure (see [Table 5](#));
- p_0 = barometric pressure, in mm Hg during the test;
- p_1 = barometric pressure, in millibars during the test; and
- p_2 = the barometric pressure, in kilopascals, during the test.

Table 4 Requirements of Thermometer
(Clauses [D-3.2.1](#))

Sl No.	Characteristic	Requirement
(1)	(2)	(3)
(i)	Immersion, mm	100
(ii)	Range, °C	72 to 126
(iii)	Graduation, °C	0.2
(iv)	Longer lines at each. °C	1
(v)	Figured at each, °C	2
(vi)	Scale error not to exceed, °C	0.2
(vii)	Overall length, mm	395 ± 5
(viii)	Stem diameter, mm	6 to 7
(ix)	Bulb length, mm	15 to 20
(x)	Distance from bottom of bulb, mm	
	to 72 °C	125 to 145
	to 127 °C	335 to 360
(xi)	Expansion chamber to allow heating to, °C	150

Table 5 Boiling Point*(Clause D-6.3)*

SI No.	Characteristic	Requirement
(1)	(2)	(3)
(i)	Boiling point °C (at 1.013 bar, 101.3 kPa, 760 mm Hg)	110.6
(ii)	Rate of change of boiling point with pressure K' (°C/mbar),	0.035
(iii)	Rate of change of boiling point with pressure K (°C/mm Hg)	0.046

ANNEX E*(Clause 6)***SAMPLING OF TOLUENE****E-1 GENERAL REQUIREMENTS OF SAMPLING**

E-1.1 In drawing, preparing, storing and handling test samples, the following precautions and directions shall be observed:

- a) Samples shall not be taken in an exposed place;
- b) Sampling instrument shall be clean and dry and shall be made of low or reduced spark generating material;
- c) Samples, the material being sampled, the sampling instrument and the containers for samples shall be protected from adventitious contamination;
- d) To draw a representative sample, the contents of each container selected for sampling shall be mixed as thoroughly as possible by shaking or stirring or both, or by rolling, so as to bring all portions into uniform distribution;
- e) Samples shall be placed in suitable, clean, dry and air-tight glass containers preferably of amber or blue colour;
- f) Sample container shall be sealed air-tight with a suitable stopper after filling and marked with full details of sampling, such as the date of sampling, the year of manufacture of material, the batch number, the name of the sample, etc. Particular care shall be taken to ensure that sealing methods do not contaminate the sample; and
- g) Samples shall be stored in such a manner that the temperature of the material does not vary unduly from the normal temperature.

E-1.2 Additional Precautions

The following additional precautions shall be observed:

- a) Rubber stoppers or composition corks shall not be used for closing the sample bottles;
- b) Sealing wax or other plastic material, if used, shall be applied in such a way that it does not contaminate the sample when the bottles are opened; and
- c) Each sample container shall be protected by covers of oil-proof paper, metal foil, viscose or other suitable impervious material over the stopper to keep away moisture and dusts from the mouth of the bottle and to protect it while being handled.

E-2 SAMPLING INSTRUMENT

The following forms of sampling instrument may be used:

- a) Sampling bottle or can for taking samples from various depths in large tanks; and
- b) Sampling tube.

E-2.1 Sampling Bottle or Can

It consists of a weighed bottle or metal container with removable stopper or top, to which is attached a light chain (*see Fig. 8*). The bottle or can is fastened to a suitable pole. For taking a sample, it is lowered in the tank to the required depth, and the stopper or top is removed by means of the chain for filling the container.

E-2.2 Sampling Tube

E-2.2.1 It is made of metal or thick glass and is about 20 mm to 40 mm in diameter and 400 mm to 800 mm in length (see Fig. 9). The upper and lower ends are conical and reach 5 mm to 10 mm internal diameter at the narrow ends. Handling is facilitated by two rings at the upper end. For taking a sample, the apparatus is first closed at the top with the thumb or a stopper and lowered until the desired depth is reached. It is then opened for a short time to admit the material and finally closed and withdrawn.

E-2.2.2 For small containers, the size of the sampling tube may be altered suitably.

E-3 SCALE OF SAMPLING

E-3.1 Lot

E-3.1.1 In a single consignment, all the containers of the same size and drawn from the same batch of manufacture shall constitute a lot. If a consignment is known to consist of containers of different sizes or of different batches of manufacture, then the containers belonging to the same size and batch of manufacture shall be grouped together and each such group shall constitute a separate lot. In case the consignment is in large tanks or vessels, the tanks or vessels belonging to the same batch of manufacture shall constitute a lot.

E-3.1.2 For ascertaining the conformity of the lot to the requirement of the specification, tests shall be carried out for each lot separately.

E-3.2 Sampling from Containers

The number of containers to be selected for sampling shall depend on the size of the lot and shall be in accordance with Table 6.

E-3.3 The containers shall be selected at random in order to ensure the randomness of selection, procedure given in IS 4905 may be adopted.

E-3.4 Sampling from Tanks or Vessels

Each of the tanks or vessels in the lot shall be sampled separately for determining the conformity of the lot to the requirements of the standard.

E-4 PREPARATION OF THE TEST SAMPLES

E-4.1 Test Samples from Containers

To ensure that the sample taken from each container is fairly representative, the containers shall be mixed thoroughly, when possible, by shaking or

stirring or rolling. Draw small samples of the material from various depths with the help of the sampling tube (see Fig. 9). The approximate quantity of the material to be drawn from a container shall be nearly equal to thrice the quantity required for testing purposes as indicated in E-5.1.

E-4.1.1 Out of the material drawn from individual containers, a small but equal quantity of material shall be taken and thoroughly mixed to form a composite sample, sufficient for carrying out triplicate determinations for all the characteristics specified under E-5. The composite sample shall be divided into three equal parts, one for the purchaser, another for the supplier and the third for the referee.

E-4.1.2 The remaining portion of the material from each container shall be divided into 3 equal parts, each forming an individual sample. One set of individual samples representing the containers selected shall be for the purchaser, another for the supplier and the third for the referee.

E-4.1.3 All the individual and composite samples shall be transferred to separate sample containers. These containers shall then be sealed airtight with stoppers and labeled with full identification particulars given in E-1.1 (f).

E-4.1.4 The referee test sample, consisting of a composite sample and a set of individual samples, shall bear the seals of both the purchaser and the supplier. They shall be kept at a place agreed to between the purchaser and the supplier, to be used in case of any dispute.

E-4.2 Test Samples from Tanks or Vessels

E-4.2.1 For drawing a sample from a tank or vessel, lower the closed sampling bottle or can (see E-2.1) slowly to the required depth, open and fill it at that depth. Three samples shall be obtained at levels of one-tenth of the depth of the liquid from the top surface (top sample), one half of the depth (middle sample) and nine-tenths of the depth of the liquid from the top surface (lower sample). All the three samples thus obtained from a tank/vessel shall be mixed together in a clean dry container, and shall be divided into three parts, one for the purchaser, another for the supplier and the third for the referee. Each of the tanks or vessels in the lot shall be sampled in the above manner and separate samples obtained for each of the tanks or vessels. The approximate quantity of the material to be drawn from a tank or a vessel shall nearly be equal to thrice the quantity required for carrying out tests for all the requirements prescribed in E-5.

E-4.2.2 All the samples thus obtained from the tanks or vessels in the lot shall be transferred to

separate sample containers. These containers shall then be sealed air-tight with stoppers and labelled with full identification particulars given in [E-1.1 \(f\)](#).

E-4.2.3 The referee test samples consisting of the samples from the tanks or vessels in the lot, shall bear the seals of both the purchaser and the supplier. They shall be kept at a place agreed to between the purchaser and the supplier, to be used in case of any dispute.

E-5 NUMBER OF TESTS

E-5.1 For Samples from Containers

E-5.1.1 Test for the determination of distillation range, if conducted, shall be conducted on each of the individual samples separately (see [E-4.1.2](#)).

NOTE — Distillation test is optional.

E-5.1.2 Tests for the determination of all other characteristics given in [Table 1](#) shall be conducted on the composite samples separately (see [E-4.1.1](#)).

E-5.2 For Samples from Tanks or Vessels

Tests for the determination of all the characteristics given in [Table 1](#) shall be conducted on the samples from different tanks or vessels, separately.

E-6 CRITERIA FOR CONFORMITY

E-6.1 For Containers

E-6.1.1 For Individual Samples

The lot shall be declared as conforming to the requirements of the distillation range if test results for each of the individual samples tested in respect of distillation range satisfy the requirements as given in [Table 1](#).

NOTE — Distillation test is optional.

E-6.1.2 For Composite Samples

In respect of all other characteristics, the lot shall be considered as conforming to the standard if the composite sample satisfies all the requirements, except distillation range, prescribed in [Table 1](#).

E-6.2 For Tanks or Vessels

The lot shall be declared as conforming to the standard if samples from each different tank or vessel satisfy the requirements prescribed in [Table 1](#).

NOTE — Distillation test is optional.

(Continued from second cover)

In this revision, considerable assistance has been drawn from the following standard published by the American Society for Testing and Materials (ASTM):

ASTM D841-19 Standard specification for nitration grade toluene

The following alternate test methods are available for the characteristics mentioned in [Table 1](#), but in case of dispute, the methods mentioned in [Table 1](#) shall be the referee method.

<i>Characteristic</i>	<i>Methods of Test</i>
Colour, Pt-Co scale	ISO 2211 ¹ , ASTM D1209, ASTM D5386
Sulphur, mg/kg	ASTM D5453
Distillation	ASTM D850, ASTM D1078, ISO 918
Toluene, percent by mass	ASTM D7504 
Non-aromatic hydrocarbons, percent by mass	
Benzene content, percent by mass	
Water content, mg/kg	ASTM D6304, ASTM E1064
Acid wash colour	ASTM D848

The composition of the Committee and Subcommittee responsible for the formulation of this standard is given in [Annex F](#).

For the purpose of deciding whether a particular requirement of this standard is complied with, the final value, observed or calculated expressing the result of a test or analysis shall be rounded off in accordance with IS 2 : 2022 'Rules for rounding off numerical values (*second revision*)'. The number of significant places retained in the rounded off value should be the same as that of the specified value in the standard.

¹Automatic tintometer/spectrophotometer may also be used with compliance to ISO 2211.

Bureau of Indian Standards

BIS is a statutory institution established under the *Bureau of Indian Standards Act, 2016* to promote harmonious development of the activities of standardization, marking and quality certification of goods and attending to connected matters in the country.

Copyright

BIS has the copyright of all its publications. No part of these publications may be reproduced in any form without the prior permission in writing of BIS. This does not preclude the free use, in the course of implementing the standard, of necessary details, such as symbols and sizes, type or grade designations. Enquiries relating to copyright be addressed to the Head (Publication & Sales), BIS.

Review of Indian Standards

Amendments are issued to standards as the need arises on the basis of comments. Standards are also reviewed periodically; a standard along with amendments is reaffirmed when such review indicates that no changes are needed; if the review indicates that changes are needed, it is taken up for revision. Users of Indian Standards should ascertain that they are in possession of the latest amendments or edition by referring to the website-www.bis.gov.in or www.standardsbis.in.

This Indian Standard has been developed from Doc No.: PCD 03 (19709).
