## *Indian Standard*

# CODE OF PRACTICE FOR SETTING OUT OF BUILDINGS

### 1. SCOPE

**1.1** This standard deals with the different stages of the setting out work, that is, the measuring of the primary framework ( traverses, grids, etc) on the site, the setting out of reference lines ( baselines ), the transfer ( plumbing up ) of reference lines to other floors, the setting out of position points and the levelling procedure for these different stages. It gives values for permissible deviations when measuring and setting out and recommends certain procedures and instruments to be used. Guidance is given on how inaccuracies can be controlled during the setting out process when using instruments and methods which are currently in common use in building construction.
