

IS 13983:1994 (Stainless steel sinks for domestic purposes - Specification)

IS 13983: 1994 specifies the standards for stainless steel sinks intended for use in domestic kitchens. It includes guidelines for different types of sinks, such as sit-on and inset designs, which are suitable for various kitchen layouts and installation styles in residential settings.

Homeowners value sinks that are durable, resistant to staining and corrosion, and easy to clean. Aesthetic appeal and compatibility with different kitchen styles are also important, as sinks are a focal point in kitchen design.

The standard mandates the use of high-quality austenitic stainless steel, which ensures robustness against daily usage and corrosion. Specifications cover essential aspects like minimum thickness, surface finish, and optional features such as tap holes and overflow outlets, ensuring both longevity and ease of installation.
